

floats

CSS Float Property

This property identifies how an element floats within a parent element. The element can float to the right, left or none within the container / parent element.

none: This is the default value of the float property. With float:none the element doesn't float

right: This makes the element get pushed to the right side of the container.

inherit: this makes the child element take the float value from the parent.

initial: this makes the float value set to the default value

Points to note about float with inline elements

- The floated inline text elements should always be having a width value. Otherwise, they will expand to fit their content which may be an issue.
- The floated inline elements acts as a block element.
- Margin on the floated element doesnot collapse.

Clear property in floats

The clear property controls the behaviour of elements that are adjacent to floated elements. It allows turn off the wrapping of the text and moves the element

below the floating element.

none: allows the element to float

left: moves the element below any left floating element.

right: moves the element below any right floating element.

both: moves below any floating element
