

Module 17 Functions Notes

Introduction to Functions

- Definition: Reusable block of code for specific tasks.
- **Advantages:**
 - Code Reusability: Use functions multiple times.
 - Less Coding: Avoid repetitive logic (DRY principle).
- **2. Function Declaration and Invoking**
 - Declaration: Use the function keyword, name the function, and write logic inside {}.
 - Invocation: Call the function by its name with () .
- **3. Function with Parameters**
 - Parameters: Listed in the function definition.
 - Arguments: Values passed during invocation.
 - Return Values: Use return to specify the output; without it, function returns undefined.
- **Function Types**
 - Declaration: Named function, no variable assignment needed.
 - Expression: Can be anonymous, stored in a variable.
- **Parameter Handling**
 - Single/Multiple Parameters: Pass as needed.
 - N Number of Parameters: Use arguments keyword.
