

Responsive Design

It is an approach using which we try to define our web apps in such a way that they look stunning on variety of screen sizes. The main goal to make a webapp responsive is to make sure our users are able to visit and consume the features without any issues.

How to achieve responsiveness for the web apps ?

To write responsive web apps we can use CSS media queries. Showing elements properly on different screen sizes is part of the beautification of our application and hence it makes sense to handle it using CSS media queries.

CSS media queries

- Media queries are rules that will help us to apply specific styles to specific screen sizes.
- They help us to decide a range of sizes on which CSS rules can be applied.
- Using the ranges for sizes we will be able to group devices into separate ranges and then style a group of devices together.

How to write media queries

The below code represents a sample media query.

```
@media media-type and (media-feature-rule) {  
    /* some css */  
}
```

- @media - This is a keyword in CSS that specifies the beginning of a media query.
- media-type - This is going to tell the type of media for applying the styles. The media types can be screen, print or all.

- media-feature-rule - This defines the specific conditions to apply underlying CSS styles as width height or screen orientation.

Media feature Rules

Media features are the conditions which we defined in our media query to apply the styles based on the conditions.

Conditions can be the following:

- min-width - If we specific min-width as x, then it means all the screen with width at-least x or more will be applied all the below css.
- max-width - If we specific max-width as x, it means all the screens with width at-most x or less will be applied the below css.
- orientation - Based on device orientation being landscape or portrait this rule decides whether the CSS should be applied or not ?
- And we can even combine multiple rules using the and operator

```
@media screen and (min-width: 500px) and (max-width: 1000px) {  
    /* this css will be applied to the screens having width >= 500px and  
    <= 1000px */  
}
```
