

Module 17 Assignment

Q1. Create an arrow function called square that takes a number as an argument and returns its square. Use the arrow function to calculate the square of a given number and display the result.

Ans) [Answer 1](#)

Q2. Create a JavaScript function called generateGreeting that takes a name as an argument and returns a personalized greeting message. Use this function to greet three different people.

Ans) [Answer 2](#)

Q3. Create an IIFE (Immediately Invoked Function Expression) that calculates the square of a number and immediately displays the result.

Ans) [Answer 3](#)

Q4. Write a JavaScript function called calculateTax that takes an income as an argument and returns the amount of tax to be paid. Use a closure to handle different tax rates based on income ranges. Test the function with various incomes.

Ans) [Answer 4](#)

Q5. Write a JavaScript function called factorial that calculates the factorial of a non-negative integer using recursion. Test the function with different inputs.

Ans) [Answer 5](#)

Q6. Write a JavaScript function called `curry` that takes a function as an argument and returns a curried version of that function. The curried function should accept arguments one at a time and return a new function until all arguments are provided. Then, it should execute the original function with all arguments. Test the `curry` function with a function that adds two numbers.

Ans) [Answer 6](#)
